

JuLit

Safe payments for new lithium companies.

An escrow on Solana for lithium sales between new producers and buyers they don't know. If nothing ships, the buyer gets the money back. Once it ships, the producer knows the money is there.

JUJUY · LITHIUM · SOLANA

New producers sell to buyers they don't know.

Big lithium companies sell to their own partners. New, small companies have no partner — and no safe way to get paid.

BIG PLAYERS

Partners

Cauchari-Olaroz (Jujuy): its owners take the lithium in proportion to their shares.¹ No trust problem to solve.

NEW PLAYERS

100%

Argosy Minerals (Salta) sold 20 t to a Hong Kong buyer, who paid everything before the ship was loaded.²

BANKS

45%

of trade finance rejections go to SMEs, which send only 38% of the requests.³

A letter of credit is expensive and needs a lot of paperwork.⁴ Of rejected SMEs that looked for other financing, 40% used their own money⁵ — with no protection.

Built for the companies banks leave out.

YES

New producers

Projects selling their first lots to buyers who are not partners or shareholders.

YES

Small buyers & traders

Companies without a bank credit line, who today must pay in advance to get the lithium.

NOT FOR NOW

Big integrated groups

Producers that sell to their own shareholders already trust their buyer. They don't need us.

Buyers must operate where stablecoin payments are legal. Mainland China bans them⁶, so mainland buyers are out of scope.

An escrow where nobody gets stuck.

01 / CREATE

Lot for one buyer

The producer creates a lot for one buyer, with a ship-by date and a window to confirm. Lots below battery grade are rejected.

02 / DEPOSIT

Money locked

The buyer deposits USDC into the escrow. The fee is frozen at that moment, and it can never be more than 2%.

03 / SHIP

Proof of shipment

The producer ships and records the hash of the bill of lading on-chain.

04 / CONFIRM

Paid on confirm

The buyer checks the lithium and confirms. At that moment, the producer gets paid.

NO DEAD ENDS

Never shipped by the ship-by date? The buyer gets a full refund. Buyer silent after shipment? The producer claims the payment when the window ends.

Rules in code, for less than one cent.

COST

< 1¢

Each step is a Solana transaction that costs less than one cent.⁷ A small lot can pay for it.

ESCROW

Held by the program

The money sits in an account owned by the lot. Only the program rules can move it: confirm, refund or timeout claim.

TITLE

One token per lot

Each lot is minted as a Metaplex token, with the hash of its spec sheet on-chain.

We earn only when the producer gets paid.

TAKE RATE

1%

A 1 percent fee, charged only when the money goes to the producer. Creating a lot, depositing and refunds are free. The fee is frozen at deposit and capped at 2%.

WHY THEY PAY

Safety

The buyer gets the money back if nothing ships. The producer ships knowing the money is locked, and can claim it if the buyer goes silent.

| We don't replace bank credit. We give a safe option to the companies that can't get it.

Working today, on Solana Devnet.

TODAY

Live on Devnet

The full flow — lot, deposit, shipment, confirm, refund and timeout claim — runs on Solana Devnet with test dUSDC. The app also includes a producer and origin directory, plus a public passport page for every lot.

```

TESTED

Program test suite

36 LiteSVM tests on the Anchor program and 176 Vitest tests on the app, including the frozen fee and every way out of the escrow.

LIMIT

The chain can't see lithium

The producer declares the lot data. There is no arbiter for quality disputes yet, and the upgrade key is a single key.

Next: a pilot lot with a producer from northern Argentina, then lab attestation on-chain and a Squads multisig for admin and upgrades.

Built in Jujuy, inside the Lithium Triangle.

We live close to the new producers we want to help.

With JuLit, the buyer is protected if nothing ships, and the producer ships knowing the money is there.
