

JuLit

Safe payments for new lithium companies.

A B2B directory and payment box on Solana. The buyer pays only when the lithium arrives, and the producer knows the money is there.

JUJUY · LITHIUM · SOLANA

New producers sell to buyers they don't know.

Big lithium companies sell to their own partners. New, small companies have no partner — and no safe way to get paid.

BIG PLAYERS

Partners

Cauchari-Olaroz (Jujuy): its owners take the lithium in proportion to their shares.¹ No trust problem to solve.

NEW PLAYERS

100%

Argosy Minerals (Salta) sold 20 t to a Hong Kong buyer, who paid everything before the ship was loaded.²

BANKS

45%

of trade finance rejections go to SMEs, which send only 38% of the requests.³

A letter of credit is expensive and needs a lot of paperwork.⁴ Of rejected SMEs that looked for other financing, 40% used their own money⁵ — with no protection.

Built for the companies banks leave out.

YES

New producers

Projects selling their first lots to buyers who are not partners or shareholders.

YES

Small buyers & traders

Companies without a bank credit line, who today must pay in advance to get the lithium.

NOT FOR NOW

Big integrated groups

Producers that sell to their own shareholders already trust their buyer. They don't need us.

Buyers must operate where stablecoin payments are legal. Mainland China bans them⁶, so mainland buyers are out of scope.

A payment box that opens only on delivery.

01 / REGISTER

Producer profile

We register each producer with its production data, like lithium purity. Every lot uses the same data.

02 / CONTRACT

Lot for one buyer

Producer and buyer sign a contract in JuLit. The producer creates a lot for that buyer.

03 / DEPOSIT

Money locked

The buyer puts the money, in USDC, into the box. Nobody can take it — not even us.

04 / DELIVERY

Paid on confirm

The lithium arrives, the buyer checks it and confirms. At that moment, the producer gets paid.

IF THE BUYER DOES NOT ANSWER The producer can collect the money after a set date, agreed in the contract.

The rules run by themselves.

ONE

A program, not a person

The box is a program on Solana. It follows the rules by itself. No bank or company holds the money.

THREE

Proof of History

It works like a shared clock: a proof of the order of events and the time between them.⁷ Everyone sees the same order — first the deposit, then the payment.

TWO

All in one step

The buyer's confirmation and the payment to the producer happen together, in one transaction. All or nothing.

FOUR

Cheap fees

Each transaction costs less than one cent⁸, so it works for every lot, even small ones.

We earn only when the payment is released.

TAKE RATE

< 1%

A fee under 1 percent, charged only when the box releases the money to the producer. Creating a lot and depositing are free.

WHY THEY PAY

Safety

The producer ships knowing the money is already locked. The buyer pays first — as small buyers already do without a bank — but now the money is protected until delivery.

| We don't replace bank credit. We give a safe option to the companies that can't get it.

Working today, on Solana Devnet.

TODAY

Live on Devnet

The full flow — contract, lot, deposit, confirm, payment — runs on Solana Devnet with test money.

BntbtLZd...Xtky · devnet

TESTED

Program test suite

The Anchor program is tested with LiteSVM, and the app with Vitest.

LIMIT

The chain can't see lithium

The blockchain proves that records were not changed. It cannot check the cargo. Today the buyer checks it before confirming.

Built in Jujuy, inside the Lithium Triangle.

We live close to the new producers we want to help.
